# **INDEXES:**

- INDEX IS AN DATABASE OBJECT WHICH IS USED TO RETRIEVE DATA FROM A TABLE FASTLY.
- A DATABASE INDEX WILL WORK AS A BOOK INDEX PAGE IN TEXT BOOK.IN TEXT BOOK BY USING INDEX PAGE WE CAN RETRIEVE A PARTICULAR TOPIC FROM A TEXT BOOK VERY FASTLY SAME AS BY USING DATABASE INDEX OBJECT WE CAN RETRIEVE A PARTICULAR ROW FROM A TABLE VAERY FASTLY.
- BY USING INDEXES, WE CAN SAVE TIME AND IMPROVE THE PERFORMANCE OF DATABASE. THESE INDEXES ARE CREATED BY DBA.
- INDEX OBJECT CAN BE CREATED ON A PARTICULAR COLUMN (OR) COLUMNS OF A TABLE AND THESE COLUMNS ARE CALLED AS "INDEX KEY COLUMNS".
- ALL DATABASES ARE SUPPORTING THE FOLLOWING TWO TYPES OF SEARCHING MECHANISMS THOSE ARE,
  - 1. TABLE SCAN(DEFAULT)
  - 2. INDEX SCAN

## **1.TABLE SCAN:**

- IT IS A DEFAULT SCANNING MECHANISM FOR RETRIEVING
DATA FROM TABLE.IN THIS MECHANISM ORACLE SERVER IS
SCANNING ENTIRE TABLE (TOP - BOTTOM)

EX:
SQL> SELECT \* FROM EMP WHERE SAL=3000;
SOL:
SAL

800

1600

1250

2975

1250

2850

2450

3000 (IN THIS TABLE SCAN WE ARE COMPARING WHERE CONDITION 14 TIMES)

5000

1500

1100

950

3000

1300

## 2) INDEX SCAN:

- IN INDEX SCAN MECHANISM ORACLE SERVER SCANNING ONLY INDEXED COLUMN FROM A TABLE. IN THIS MECHANISM WE AGAIN FOLLOW THE FOLLWOING TWO METHODS,

## I) AUTOMATICALLY / IMPLICITLY:

- WHENEVER WE ARE CREATING A TABLE ALONG WITH "PRIMARY KEY" (OR) "UNIQUE" KEY CONSTRAINT THEN INTERNALLY SYSTEM IS CREATING AN INDEX OBJECT ON THAT PARTICULAR COLUMN AUTOMATICALLY.

#### EX:

SQL> CREATE TABLE TEST1(EID INT PRIMARY KEY, ENAME VARCHAR2(10));

SQL> CREATE TABLE TEST2(SNO INT UNIQUE, NAME VARCHAR2(10));

## **NOTE:**

- IF WE WANT TO VIEW INDEX NAME ALONG WITH COLUMN NAME OF A PARTICULAR TABLE THEN WE USE "USER\_IND\_COLUMNS" DATA DICTIONARY.

## EX:

SQL> DESC USER\_IND\_COLUMNS;

SQL> SELECT COLUMN\_NAME, INDEX\_NAME FROM USER\_IND\_COLUMNS WHERE TABLE\_NAME='TEST1';

SQL> SELECT COLUMN\_NAME, INDEX\_NAME FROM USER\_IND\_COLUMNS WHERE TABLE\_NAME='TEST2';

COLUMN\_NAME INDEX\_NAME

-----

SNO SYS\_C005502

## **II) MANUALLY / EXPLICITLY:**

- WHEN USER WANT TO CREATE AN INDEX OBJECT ON A PARTICULAR COLUMN/(S) THEN WE FOLLOW THE FOLLOWING SYNTAXS,

## **TYPES OF INDEXES:**

- 1. B TREE INDEX (DEFAULT INDEX)
  - SIMPLE INDEX
  - COMPOSITE INDEX
  - UNIQUE INDEX
  - FUNCTIONAL BASED INDEX
- 2. BITMAP INDEX

## **SIMPLE INDEX:**

- WHEN WE CREATED AN INDEX ON A SINGLE COLUMN THEN WE CALLED AS SIMPLE INDEX.

## **SYNTAX:**

CREATE INDEX <INDEX NAME> ON <TN> (<COLUMN NAME>);

EX:

SQL> CREATE INDEX SIND ON EMP(SAL); INDEX CREATED.

EX:

SQL> SELECT \* FROM EMP WHERE SAL=3000;

## SOL:

NOTE: IN INDEX SCAN WE ARE COMPARING 3 TIMES.WHICH IS MUCH FASTER THAN TABLE SCAN (14 TIMES COMPARING). HERE " \* " IS REPRESENT ROWID.

## **COMPOSITE INDEX:**

- WHEN WE CREATED AN INDEX ON MULTIPLE COLUMNS THEN WE CALLED AS COMPOSITE INDEX.

## **SYNTAX:**

CREATE INDEX <INDEX NAME> ON <TN> (<COLUMN NAME1>, <COLUMN NAME2>, .....);

#### EX:

SQL> CREATE INDEX CIND ON EMP (DEPTNO, JOB); INDEX CREATED.

NOTE: ORACLE SERVER USES ABOVE INDEX WHEN "SELECT" QUERY WITH WHERE CLAUSE IS BASED ON LEADING COLUMN OF INDEX,I.E (DEPTNO).

EX:

SQL> SELECT \* FROM EMP WHERE DEPTNO=10; (INDEX SCAN)

SQL> SELECT \* FROM EMP WHERE DEPTNO=10 AND JOB='CLERK'; (INDEX SCAN)

SQL> SELECT \* FROM EMP WHERE JOB='CLERK'; (TABLE SCAN)

## **UNIQUE INDEX:**

- WHEN WE CREATE AN INDEX BASED ON "UNIQUE CONSTRAINT" COLUMN IS CALLED UNIQUE INDEX.UNIQUE INDEX DOES NOT ALLOW DUPLICATE VALUES.

**SYNTAX:** 

CREATE UINQUE INDEX <INDEX NAME> ON <TN> (<COLUMN NAME>);

EX:

SQL> CREATE UNIQUE INDEX UIND ON DEPT(DNAME);

INDEX CREATED.

**TESTING:** 

**SQL> INSERT INTO DEPT VALUES (50,'SALES','HYD')** 

**ERROR AT LINE 1:** 

ORA-00001: UNIQUE CONSTRAINT (SCOTT.UIND) VIOLATED.

NOTE: PRIMARY KEY COLUMNS AND UNIQUE COLUMNS ARE AUTOMATICALLY INDEXED BY ORACLE.

#### **FUNCTIONAL BASED INDEX:**

- WHEN WE CREATE AN INDEX BASED ON FUNCTION THEN WE CALLED AS FUNCTIONAL BASED INDEX.

#### SYNTAX:

CREATE INDEX <INDEX NAME> ON <TN>(<FUNCTION NAME>(COLUMN NAME));

EX:

SQL> CREATE INDEX IND4 ON EMP(UPPER(ENAME)); INDEX CREATED.

SQL> SELECT \* FROM EMP WHERE UPPER(ENAME)='SCOTT';(INDEX SCAN)

## 2. BITMAP INDEX:

- BITMAP INDEX IS CREATED ON DISTINCT VALUES OF A PARTICULAR COLUMN.GENERALLY BITMAP INDEXES ARE CREATED ON LOW CARDINALITY OF COLUMNS.
- WHEN WE CREATE BITMAP INDEX INTERNALLY ORACLE SERVER IS PREPARING BITMAP INDEXED TABLE WITH BIT NUMBERS ARE 1 AND 0. HERE 1 IS REPRESENT CONDITION IS TRUE WHERE AS 0 IS REPRESENT CONDITION IS FALSE.

## **CARDINALITY:**

- IT REFERES TO THE UINQUENESS OF DATA VALUES CONTAINE IN PARTICULAR COLUMN OF TABLE.

## **HOW TO FIND CARDINALITY OF A COLUMN:**

CARDINALITY OF COLUMN = NO. OF DISTINCT VALUES OF A

**COLUMN** 

.....

NO. OF ROWS IN A TABLE

EX:

CARDINALITY OF EMPNO = 14

\_\_\_\_\_

14

**CARDINALITY OF EMPNO IS "1" ----(CREATING BTREE INDEX)** 

EX:

14  CARDINALITY OF JOB = 0.35 (CREATING BIT MAP INDEX	)
CARDINALITY OF JOB = 0.35 (CREATING BIT MAP INDEX	)
SYNTAX:	
CREATE BITMAP INDEX <index name=""> ON <tn>(<column name="">);</column></tn></index>	
EX:	
CREATE BITMAP INDEX BITIND ON EMP(JOB);	
EX:	
SELECT * FROM EMP WHERE JOB='MANAGER';	
BITMAP INDEXED TABLE	
=======================================	
JOB 1 2 3 4 5 6 7 8 9 10 11 12 13 14	
=======================================	
CLERK 1 0 0 0 0 0 0 0 0 1 1 0 1	
SALESMAN 0 1 1 0 1 0 0 0 0 1 0 0 0 0	

ANALYST	0		0	0	- 0	0	0	1	0	0	0	0	1	0
													_ <del>_</del>	
					-									
PRESIDENT	0	0	0	0	0	0	0	0	1	0	0	0	0	0
========	==	==	==	==	==	==	==	==	==	===	===	===	===	====
NOTE: HERE "1" IS REPRESENTED WITH ROWID OF A PARTICULAR ROW IN A TABLE.														
NOTE:														
- IF WE WANT TO VIEW INDEX NAME ALONG WITH INDEX TYPE THEN WE USE "USER_INDEXES" DATADICTIONARY.														
EX:														
SQL> DESC US	ER_	IN	DE)	KES	;									
SQL> SELECT I	ND	EX_	NA	ME	, IN	NDE	<b>X</b> _	TYI	PE F	RON	1 US	ER_	INDE	XES
